         This DNA sequence comprises a mutated ACl gene of tomato mottle virus (TOMOV). It carries an inserted 4-base Sau3A site that shifts the ACl gene translation reading frame resulting in the expression of a truncated ACl protein (see AAM3437). The ACl gene (see also AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A and DNA-B, of the bipartite TOMOV genome. The invention involves production of transgenic plants
                                                                                                                                                             Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean
                                                                                                                                                                                                                                                                                       (SEMI-)

virus (ToMov). It encodes an Acl protein (see AAW34324) that carri mutations in its NTP-binding domains. The Acl gene (see also AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A-and DNA-B, of the bipartite ToMov genome.
                                                                                                                          Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The ACL/CI genes are especially from TOMOV, tomato yellow leaf curl virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding
                                                                                                                                                                                                                                                                                                                                                                                                CDS
                                                This DNA sequence comprises a transdominant lethal mutant, designated ToMoV-AC1dlm, of the AC1 gene of tomato mottle virus
                                                                                        Claim 11;
                                                                                                              golden mosaic geminivirus
                                                                                                                                                                              P-PSDB;
                                                                                                                                                                                                                  Ahlquist PG,
                                                                                                                                                                                                                                          (SEMI-)

The invention involves production of transgenic plants containing DNA comprising geminivirus ACl or Cl wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The ACl/Cl genes are especially from ToMOV, tomato yellow leaf curl virus or bean golden mosaic geminivirus (see AAT93288-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding
                                               domains.

1.
Pred. N
score g
and is
No. is the number of results predicted by chance to have greater than or equal to the score of the result being pr s derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990: 1990:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-stranded cDNA was digested with Not I and cloned into the Not I and Eco RV sites of the pCMVSPORT 6 vector. Library was constructed by Tife.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /clone_llb="LTI_FL013_FBrn1"

polylinker; Site_1: Not I; Site_2: Bco RI; The UI-R-CO
library is a subtracted library derived from the UI-R-Al
and UI-R-EI libraries. The UI-R-AI library consisted of a
mixture of individually tagged normalized libraries
constructed from rat placentd, adult lung, brain, liver,
kidney, heart, spleen, ovary, and muscle. The UI-R-EI
library consisted of a mixture of individually tagged
normalized libraries constructed from 8, 12 and 18-day
embryo. The tag is a string of 3-5 nucleotides present
between the Not I site and the oligo-dT track which
allows identification of the library of origin of a clone
within the mixture. The subtracted library (UI-R-CO) was
constructed as follows: PCR amplified cDNA inserts from a
pool of UI-R-A1 and UI-R-EI clones from which 3' ESTs had
been derived was used as a driver in a hybridization with
the pooled UI-R-A1 and UI-R-EI library in the form of
single-stranded circles. The remaining single-stranded
circles (subtracted library) was purified by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1996)

                                                                                                                                                                                                                                                                                                              embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CO) was constructed as follows: PCR amplified CDNA inserts from a pool of UI-R-A1 and UI-R-E1 clones from which 3' ESTS had been derived was used as a driver in a hybridization with the pooled UI-R-A1 and UI-R-E1 library in the form of the pooled UI-R-A1 and UI-R-E1 library in the form of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /lab_host="DHIOB (Life Technologies)"

twiere's differences are found these are annotated as variation together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.  This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key.  HMCORTANT: This sequence is not the entire insert of clone 218118. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between the true right end of clone 27K14 (299125) is at 100 in this sequence. This sequence was generated from part of bacterial clone contigs of human chromosome X. Gonstructed by the Sanger Contre through the library RPCI6 constructed at the Roswell Park Generi Institute by the group of Pleter de Jong. For further Generian Stitute by the group of Pleter de Jong. For further Contre Note: "MEDIB repeat: matches 1394 of consensus" region 1840. 1895  111994  / Clone_lib="RPCI-6"  / Chromosome="X"  / Conce:"REF-218118  / Colone_lib="RPCI-6"  / Chromosome="X"  / Conce:"REF-218118  / Colone_lib="RPCI-6"  / Chromosome="X"  / Chromosome="X"  / Choice:"REF-218118  / Colone_lib="RPCI-6"  / Chromosome="X"  / Choice:"REF-218118  / Colone_lib="Ref-218118  / Colone_lib="Ref-218118  / Colone_lib="Ref-21818  / Colone_lib="Ref-2181	Submitted (26-NOV-1998) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo sapiens chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
